

Accessibility tools introduced:

- Color contrast (high)
- Strong visual hierarchy
- Readability, font size, centered text
- Usable buttons and links
- Alt text for images
- Responsive images by default
- Images should be compressed as much as possible

Notes:

“Lawsuits against website owners alleged to have breached the Americans with Disabilities Act have increased rapidly during the first half of 2023 across virtually every metric conceivable.”

There are four main types of accessibility: Visual, auditory, motor and cognitive

Avoid uneven spacing and keep consistent throughout the entire page for readability.

Left-align body text is best in general. Centered paragraphs are harder to read especially for people with dyslexia or other reading difficulties.

Screen readers rely on alt text to describe what images depict.

All Images should contain an alt text for users.

People who are blind can use screen readers which makes it important to reiterate what an image depicts

When creating online forms we must consider people who require software to read text out loud

It is common for inaccessible web sites to be met with a lawsuit from the ADA (Americans with Disabilities Act)
